A Console-Based Solution

# SYSTEM ARCHITECTURE

Question ID

Options A-D

Marks

Student Results

Core Data Structures: struct Question { int questionID; string questionText; string options[4]; char correctAnswer; int marks; } | struct StudentResult { int studentID; string studentName; int totalMarks; int obtainedMarks; float percentage; char grade; int correctAnswers; int incorrectAnswers; int unanswered; }

Online Examination Management System

# QUESTION MANAGEMENT

## Sequential Display & Input Handling

Questions are presented one at a time using a structured loop, each showing the question ID, text, and four labeled options (A–D). The system prompts the user to enter their answer before advancing to the next question.

## Unanswered Question Handling

If a user skips or leaves a question blank, the system flags it as unanswered, assigns zero marks, and records it separately. This ensures accurate score calculation and complete result tracking across all attempted questions.

# SCORE CALCULATION & GRADING

## MARKS & PERCENTAGE

The system calculates total marks by summing scores for each correct answer. Unanswered questions are assigned zero marks automatically. Final percentage is computed as  $(\text{Marks Obtained} / \text{Total Marks}) \times 100$ , giving an accurate performance metric for every student.

## GRADE ASSIGNMENT

Grades are assigned based on percentage thresholds: A+ (90-100%), A (80-89%), B (70-79%), C (60-69%), D (50-59%), and F (below 50%). Each student result is stored in a structure, enabling detailed score reports and multi-student performance tracking.

# RESULT ANALYSIS

Track individual student performance with detailed result breakdowns. View correct vs. incorrect answers side-by-side, calculate scores and percentages, assign grades automatically, and generate comprehensive performance reports for every student.

# MULTI-STUDENT DATA MANAGEMENT

**Student Result Storage:** Each student record stores a unique ID, name, total marks scored, percentage, and assigned grade. Structures are used to maintain multiple student results simultaneously, enabling efficient data organization across all exam sessions.

**Performance Retrieval:** The system retrieves and displays individual student performance data on demand.

Administrators can review correct vs. incorrect answers per student, generate consolidated performance reports, and compare results across the entire student cohort.

The system generates comprehensive performance reports for every student. Each report includes total score, percentage, and assigned grade (A, B, C, D, or F). A full answer breakdown displays correct and incorrect responses, enabling detailed review. Multiple student results are stored and compared, providing educators with actionable insights into class-wide performance trends.

# PERFORMANCE REPORT GENERATION

# CONCLUSION

The Online Examination Management System delivers a complete, end-to-end assessment workflow — from displaying questions one by one and accepting student responses, to calculating marks, handling unanswered questions, and computing the final score with percentage and grade assignment.

Built using C++ structures for questions and student results, the system maintains multi-student records, displays correct and incorrect answers post-exam, and generates a comprehensive performance report — making it a robust, console-based solution for modern examination management.

Online Examination Management System

EXAMSYS PRO

PRESENTATION

# THANK YOU

Ready to implement an efficient, structured Online Examination Management System — automating question delivery, answer evaluation, grade calculation, and performance reporting for every student with precision and ease.
